ANALYST ASSIGNMENT

EQUITY RESEARCH

BY-Antriksh Goenka(25B0315)

1. India's Position in the Global Crude Oil Market

Demand

India is set to become the **largest source of global oil demand growth** through 2030, contributing ~1.2 mb/d out of the projected 3.2 mb/d global gains it is over **one-third of total global growth**. This is driven by urbanisation, industrialisation, and a rising middle class. Total demand is expected to reach **6.6 mb/d by 2030**. Atleast till 2030, Oil companies will be increasing their revenue through refining etc.

Import Dependency

India is already the **world's second-largest crude oil net importer**, having grown imports by 36% over the past decade to **4.6 mb/d in 2023**. This is projected to rise further to **5.8 mb/d by 2030** as refinery intake increases , making supply security a critical concern as seen in recent month for LPG imports due to closure of strait of hormuz.

Domestic Production

India is a **relatively small producer**, contributing only **13% of its own supply needs**. Production stood at ~700 kb/d in 2023 and is expected to **decline to 540 kb/d by 2030** due to a lack of new discoveries, despite government efforts to attract foreign investment.

Refining & Export Role

India is aggressively expanding refining capacity, adding **1 mb/d of new distillation capacity** more than any country outside China. In 2023, it was the **4th largest exporter of middle distillates** and **6th largest refinery product exporter globally** at 1.2 mb/d. That's a good sign for economy.

Imports(in Metric tonnes for LPG and 10*Metric tonnes for Oil)

US–Israel strikes on Iran (28 Feb 2026) effectively closed the strait. Crude volumes fell 17% in March. LPG imports collapsed ~73% from Jan to Apr as ~90% of LPG imports passed through the strait. April figures are provisional estimates.

India's hotels and restaurants were among the hardest hit. Commercial LPG prices jumped **₹114.50 per cylinder** on March 9 alone, with cumulative 2026 hikes reaching ₹302.50 per 19-kg cylinder. Since LPG makes up 8–15% of kitchen costs, roughly 40% of businesses were forced to scale down, with those affected reporting around **50% revenue loss**. Nearly **10,000 restaurants shut** across Tamil Nadu. Mumbai had 50% closures or controlled curbing of operations citywide, while hotels already on piped gas managed it better. At the macro level, the sector contributes \$250 billion to GDP and employs 46.5 million people that overall slows down the economy and the market.

2. Effects of Rising Crude Oil Prices on the Indian Economy

Crude oil prices surged **75.4%** from **\$61.11/bbl (Dec 31, 2025)** to **\$107.17/bbl (Apr 30, 2026)** following the Strait of Hormuz closure. For India, which imports **88.6% of its crude**, this significantly increase cost and will slow down GDP due to inflation.

Every **\$10 rise in crude pushes retail inflation up by 0.20 percentage points** meaning this \$46 spike alone adds **~1%** to inflation. CPI inflation is now projected at **4.6% for FY27** (Q3 seen at 5.2%), up from a comfortable 3.21% in February 2026. GDP growth has been revised down from RBI's pre-crisis forecast of **7.3%** to the IMF's current projection of **6.5% for FY27**.

Sectors Declining

Aviation :- Jet fuel is 30–35% of operating costs. A 75% crude spike crushes margins with almost no room to recover through ticket pricing. Recent Spirit Airlines shut confirms this.

Hospitality :- Higher LPG costs on one side, weaker consumer spending on the other. ~40% of businesses have scaled down, reporting ~50% revenue loss.

Transport & Logistics :- Diesel prices pass through into freight costs, raising prices across cement, food, and consumer goods.

Import-dependent Manufacturing :- Plastics, chemicals, and electronics face rising input costs and decreasing export competitiveness.

Sectors Benefitting

Renewable Energy :- Oil at \$107/bbl makes solar, wind, and green hydrogen far more economically attractive, accelerating investment into Adani Green, Tata Power, NTPC Green.
Ex- Adani Energy stock increased 45% in just one month.

Domestic Oil Producers :- ONGC and Oil India earn higher money per barrel, directly boosting revenues.

Coal India :- Industries shift away from expensive gas/oil back to coal or in india it is wood (traditional cooking) as a cheaper substitute.

3. **Crude surged 75.4% (\$61 → \$107/bbl). My positions are built entirely around this disruption.**

LONG

Green Energy :- Oil at \$107 makes renewables economically far better. Long **Adani Green, Tata Power, NTPC Green.**

Defence (Established) :- Government spending is guaranteed due to security reasons. Long **HAL, BEL etc.**

Defence (New-Age) :- Modern warfare runs on drones. Long **IdeaForge Technology** as the structural shift toward unmanned systems accelerates. (Note:- IdeaForge have seen a huge decline in recent years, my recommendation is based given it's performance better than Average so invest only if it shows a good financials and fundamentals)

Gold :- Classic geopolitical hedge. Holds value as inflation rises and rupee weakens.

Crude Futures (Tactical) :- Short-term long on MCX crude to capture the disruption premium before supply normalises.

SHORT

Hospitality :- Input costs up, consumer spending down. ~40% businesses already scaling back.

Aviation :- Jet fuel is 30–35% of costs. A 75% crude spike with limited pricing power is a clean short. **IndiGo, SpiceJet** most exposed.

LONG :- But Later (Banking)

Banks underperform during war but recover sharply after. I'll watch for ceasefire signals, then long **SBI, HDFC Bank, ICICI Bank** at first sign of de-escalation.

Money Market:- No Position

RBI's NDF ban and caps on onshore open positions, combined with higher hedging costs, make this too restricted and expensive to operate in right now. Staying out entirely.

2. The Rise of the US Dollar as the World's Reserve Currency

1913:- Federal Reserve Act The US establishes its central bank, creating a credible and unified monetary system that led to the foundation of a globally trusted currency.

1914–1918 :-World War I European nations abandon the gold standard to finance war expenses, devaluing their currencies. **The US becomes the Allies' primary supplier and lender**, accumulating the majority of the world's gold reserves in return.

1931 :- Britain Exits the Gold Standard Britain abandons gold convertibility, **decimating the pound's credibility as the world's reserve currency**. The dollar comes forward in as the most trusted alternative of that time.

1939–1945 :- World War II The US again supplies and finances the Allied powers, further increasing its gold holdings. By 1945, most nations have exhausted their reserves **which made a return to gold backed currencies impossible for everyone except America**.

1944 :- Bretton Woods Agreement 44 Allied nations formally peg their currencies to the US dollar, with the dollar alone remaining convertible to **gold at \$35/ounce**. Countries begin holding dollars and US Treasury bonds as reserve assets instead of gold thus officially making the dollar as the world's reserve currency.

1971 :-Nixon Decision Excessive Vietnam War spending flooded global markets with dollars, triggering a loss of confidence. **Nations rush to convert dollar reserves back into gold**. **President Nixon suspends gold convertibility entirely**, ending Bretton Woods yet the dollar retains its dominance due to the depth and stability of US financial markets.

Today As of Q1 2025, global central banks still hold **~57.74% of their reserves in US dollars**.

Why the World Still Runs on the Dollar

No credible alternative exists The Euro is fragmented across 20 economies with no unified fiscal policy. The Chinese Yuan remains capital controlled as Beijing restricts free flow of money in and out, making it unsuitable as a reserve currency. **Gold is impractical at modern trade volumes**. The dollar simply has no replacement as of now.

US Treasury bonds are the world's safest asset Every central bank around the world parks its reserves in US Treasury securities. They are the most liquid, most trusted debt instrument in existence. Over **\$9.36 trillion** is held by foreign governments alone.

Issue is that Oil is priced in dollars, the Petrodollar system Since the 1970s, OPEC nations agreed to sell oil exclusively in dollars. **Every country that imports oil must hold dollar reserves to pay for it.** This creates a permanent, self reinforcing global demand for the dollar.

89% of global forex transactions involve the dollar When a Brazilian company buys goods from a Vietnamese supplier, the transaction is almost certainly settled in dollars and not in a local currency.

Network effects Switching costs are enormous. Banks, contracts, commodity markets, and financial instruments are all dollar denominated. **Shifting away from the dollar would require simultaneous coordination across every economy** in the world which is as of now impossible.

2. Under the Gold Standard (Pre-1971) The relationship was fixed at \$35/ounce under the Bretton Woods agreement. The two assets moved together. (correlation coefficient=1)

Post-1971 : Inverse correlation coefficient era President Nixon ended gold convertibility of the US dollar thus a new dynamic emerged. Gold and the dollar developed an inverse relationship i.e. when the dollar strengthens, gold falls, and when the dollar weakens, gold rises. Since gold is globally priced in dollars, a weaker dollar makes gold cheaper for foreign buyers, driving demand and price upward thus making gold expensive. That's how inverse relation work. (correlation coefficient from -0.5 to -0.85)

However, from 2023 we witnessed an unusual phenomenon: both gold and the dollar demonstrated significant strength simultaneously. **Gold prices surged past \$5,000 per ounce at its peak and set new all-time highs, while the U.S. Dollar also strengthened and therefore Rupee weakened.**

3. Several domestic economic factors contribute to the weakening of the Indian Rupee against the US Dollar

Current account deficit:- India's current account deficit (CAD) has been widening due to higher imports than exports. Thus making dollar more strong due to its demand and rupee weaker. Speculators short rupee and thus this momentum of shorting makes rupee more weaker.

Inflation Higher:- factors like- war, oil prices etc **raises inflation thus reduces purchasing power, making it less attractive compared to currencies of countries with lower inflation rates.** constant inflationary pressures can lead to a steady decline in the rupee's value.

Capital outflows:- Foreign investors often **withdraw funds from Indian markets during periods of global uncertainty** or when interest rates rise in developed economies like the US by FED. Such capital outflows increase demand for the USD, putting additional pressure on the rupee.

Fiscal deficit:- A high fiscal deficit, which occurs when **government expenditure exceeds revenue, often leads to increased borrowing**. This can weaken investor confidence in the economy, further contributing to the depreciation of the rupee.

My Take: The Rupee's current slide isn't a failure, it's driven by massive FPI outflows, high oil costs, and US tariff threats. Crucially, the RBI is letting this happen. Instead of burning forex reserves, they are executing a controlled slide to let the currency find a new market driven mean. (Currencies like the Euro or Yuan are stable right now simply because they lack these specific import and tariff issues).

Since the Rupee is hitting technical resistance, it will find its floor and stabilize soon.

Here is a take as a Equity analyst:

1. **The Hedge:** put money in 52 week US Treasury bills right now. This locks in a secure yield and shields us while the Rupee finishes its slide while giving good safe returns.
2. **The Pivot:** The second the currency and domestic inflation stabilize or get near to stabilization, rotate aggressively into Indian bonds. India offers some of the highest real interest rates in the world in recent times, and locking those in post stabilization will generate great return from fixed income securities.

CURRENCY EXCHANGE RATES VS USD — INDEXED (MAY 2024 = 100)

4. Impact on Country B's Economy (Rate Cut)

Cheaper borrowing Loans become less expensive for businesses and individuals, encouraging spending and investment. This boosts consumption and capital expenditure across sectors.

Higher inflation pressure More money flows into the economy, increasing demand for goods and services. If **supply does not match**, **prices start rising**.

Currency depreciation Lower interest rates make B's currency **less attractive to foreign investors**. Demand for the currency falls, weakening its value in forex markets.

Boost in exports, costlier imports A weaker currency makes B's goods cheaper abroad, increasing export competitiveness. **Imports become expensive, which can widen the trade deficit in the short term.** (Given they have similar items in imports/exports)

Stock market rally, bond yields fall Equities usually rise(needs specific conditions mentioned in answer of 4th question) as **borrowing costs drop and corporate profits improve. Existing bond prices rise** (since old bonds offer higher yields than new ones), but new bond yields fall.

Capital outflows Investors may move money to countries offering higher returns. This can pressure B's financial markets and currency further.

Impact on Country A's Reserves and Economic Position

Loss in value of cash reserves Since B's currency depreciates, **the cash portion of A's reserves loses purchasing power** when converted to other currencies. A effectively holds a less money.

Bond holdings see mixed effects Existing bonds held by A gain in market price (capital gain) because their fixed coupon is now more attractive than newly issued lower yield bonds.

Lower yield income Any reinvestment of matured bonds or new bond purchases will earn reduced interest. **A's passive income from reserves shrinks over time**(Countries generally do not hold direct cash in reserves instead hold them in bonds so they can earn interest rates).

Reserve diversification pressure A to consider shifting reserves to **stronger currencies or gold to protect value**. This is a common response when a reserve currency weakens persistently.

Trade position shifts A's exports to B become more expensive for B (since B's currency is weaker), potentially hurting A's exporters due to low demand driven by inflation. **Imports from B become cheaper**, which may benefit A's consumers but hurt domestic producers competing with B.

Strategic and geopolitical impact Holding large reserves in a depreciating currency **reduces A's financial leverage**. A may push for trade settlements in alternative currencies to reduce dependence on B.

3. PTC India(ISIN:-INE877F01012)

1.PTC India operates as the market leader in power trading, acting as an **intermediary between power generators and distributors (discoms)** to facilitate electricity sales. It utilizes a portfolio approach for short, medium, and long term trades, including cross border trading, earning revenue primarily through **trading margins, consultancy services, and interest on payment delays**.

Key Cost drivers are:-

1.**Power purchasing cost**:-PTC buys power directly from generation companies to sell to buyers, making this the primary cost driver. To hedge against sudden cost spikes and increased working capital requirements, the company must maintain a **strict ₹2,000 CR war chest at all times**.

2.**Surcharge Expenses Paid to Generators**:-When PTC delays payment to generators, it pays a surcharge penalty.This goes through the finance cost line. In Q3 2025 when the discom stress was high, **PTC paid 25 cr rupees and in Q3 2026 , it only paid 2.49 cr rupees** thus significantly decreasing the finance cost.

3.**Rebates given to buyers and interest on working Capital cost**:-early payment benefits to buyers and it gives interest on debt for working capital, the interest was 3 cr indicating very less debt.

Other cost are:-Employee and Control Room Operations ,Technology and Platform Investment,Consultancy Delivery Cost Relatively small etc.

what ultimately drives profitability is the margin between buying and selling , the consultancy deliveries.

2.**Market's current view of the stock**

Historical Price Trends:- Over the past decade, PTC India traded in a small ₹40-₹125 range, characterized by high volatility. In early 2024, the stock broke out to an all time high of ₹250 before correcting sharply to ₹134. Recently, the geopolitical tension driven by the Middle East conflict has escalated the price back to ₹207 as of April 30.

Valuation Multiples:- The stock remains structurally undervalued. **Over the last 10 years, the P/E ratio has hovered between 5x and 10x, significantly lagging the sector average of 18x-23x. The Price/Sales ratio sits near 0.3**, further indicating a deep discount. While the Price/Book ratio recently crossed 1.0 due to the sector-wide momentum from the Iran conflict, the baseline valuation remains low.

Investor Sentiment & Risk Factors:- The primary drag on PTC's valuation is internal governance. Recent news regarding the abrupt cessation and unexplained resignations of key

directors and managers has created significant uncertainty regarding internal politics. This governance deficit has led to institutional capital withdrawal, keeping the stock undervalued despite strong macro tailwinds. While the current energy crisis has created short term upward momentum, a **post conflict price correction is highly probable**. Even with new green energy deal, investors remain cautious due to fear of new board of directors that are not critical of promoters and ignoring the company own performance compared to it's peers.

3. My Investment Thesis: PTC India

My main argument is that we should wait for the current Middle East energy disruption to stabilize before buying in. Right now, the stock price has spiked to around ₹207 because of the crisis, but once things settle down, big investors are going to book their profits. When that happens, I expect the price to drop back down to its pre war levels of around ₹160-₹170. That is our buying window.

Here is why this makes sense fundamentally:

1. **The stock is heavily undervalued right now**. At the ₹160-₹170 price range, PTC's P/E ratio will drop to roughly 6.3. To put that in perspective, the standard P/E for the power sector is usually between 18 and 23. The only reason it is this cheap is because **investors are spooked by the recent internal drama specifically the sudden resignations, management reshuffles and fine imposed by SEBI for ill-governance**. But in my view, that is just short term noise. Once the management situation stabilizes, investors will realize how cheap the stock is and pump money back into it. We can easily expect returns **above 12%**, which beats standard index funds.

2. **The weather** guarantees long term demand. Looking outside the company itself, extreme weather is becoming the new normal. **Hotter summers (pushed by El Niño)** mean people are running more ACs, and harsher winters mean more heaters. This directly increases energy consumption, a **1 degree** rise in temperature increases **2% energy consumption** that directly impacts PTC's net revenue. Furthermore, energy production in India is expanding at the same pace as demand, meaning PTC won't get squeezed on their profit margins due to regulatory pricing pressure.

3. **They have a massive advantage in cross-border trade**. People are focusing too much on the management crisis and ignoring PTC's actual business. They are incredibly active in cross border energy trading across Bhutan, Nepal, and Bangladesh. For example, they recently handled a massive deal supplying 118MW energy to Assam from the Nikachu project in Bhutan. On top of that, their push into green energy infrastructure by dealing with NCRTC gives them a highly stable, long-term revenue stream that isn't reliant on traditional fuels.

4. "High growth companies deserve high valuations"

When is the statement true:- **Returns Exceed Cost of Capital:** Growth creates value only if the Return on Capital (RoC) is consistently higher than the Cost of Capital (CoC).

High Gross Margins & Scalability: The company has a business model (like Saas) that promises **high gross margins**, where revenue growth eventually translates into big profits.

Future Profitability: While temporary losses are acceptable, the company must show a clear, **realistic path to profitability** as it scales.

Significant Competitive Advantages: Proprietary Technology or IP like patents creates a barrier to entry, **defending high margins from competitors**, High switching cost prevents customers from switching systems thus locking profits. Last one is Strong brand reputation like-Google

Efficient Capital Allocation: The company is efficient at **converting sales/marketing spend into new revenue**, rather than merely buying growth at an unsustainable cost.

A leadership team with a track record of **executing strategic growth** and delivering on projections

Favorable Macroeconomic Context: other factors include lower interest rates often justify higher valuation multiples, as they reduce the cost of capital and increase the NPV of future earnings.

When this statement fails:-

Expectations Become the Enemy as High valuations price in perfection. **Zomato fell 62% from its listing price(with 14% over a single day when one year share lock-in period ended)** not because the business failed but because growth decelerated slightly.

Cash Burn as fuel for Growth Revenue growth funded by discounting and aggressive customer acquisition is not real growth. Paytm was valued at **Rs. 1.39 crore at IPO on user metrics that never converted to unit economics**. The moment spending slowed, the growth disappeared entirely because there was no underlying pricing power or retention.

Governance sometimes Overrides Business Quality Structurally sound companies get undervalued when internal problems surface. **PTC India trades at roughly 8x earnings against a sector average of 18-23x despite 9% volume growth**. The entire undervaluation is attributable to board non-compliance, director resignations, and management reshuffling none of which damage the actual business in long term.

Macro activities over company performance Rising interest rates mechanically compress growth valuations as future cash flows discounted at higher rates make the NPV low of the

company. **The 2022 global rate hike cycle wiped out valuation premiums across high growth companies universally regardless of business quality.** War, inflation, and risk off sentiment reduce the multiple the market assigns to any growth story, however legitimate.

"A weakening rupee benefits Indian companies"

When does this statement hold true:- primarily when a company's foreign currency earnings or competitive gains grow faster than the cost inflation that rupee depreciation simultaneously creates.

Export Competitiveness Indian goods become **cheaper for foreign buyers** in dollar terms. Exporters can either pass on the price advantage to gain volume or hold prices and pocket the margin expansion. This works for textiles, pharmaceuticals, chemical. The condition :- the company must be a net exporter with limited imported raw material dependency, otherwise the input cost inflation eats the gain.

IT Services India's IT sector like:- TCS, Infosys, Wipro etc bills clients in dollars and reports in rupees. Every rupee of depreciation directly **expands reported revenue and margins** without any operational change.

Remittances NRI remittances into India is one of the world's largest at roughly **\$120 billion annually this convert at a higher rupee rate when the currency weakens**. This directly boosts household consumption in recipient states, benefiting FMCG and retail domestically.

Foreign Asset Holders Any Indian company or investor holding dollar denominated assets, foreign subsidiaries, or overseas investments sees those **holdings appreciate in rupee terms automatically when the rupee weakens**, boosting consolidated balance sheet valuations.

When the statement fails:-

Crude Oil and Raw Material Cost Spike India imports 85% of crude oil in dollars. Rupee depreciation directly inflates input costs for **IOCL, HPCL, BPCL, fertiliser companies, and electronics assemblers with no pricing power to cover it**. India spent \$134 billion (16% less than previous year due to discounted Russian oil) on oil imports in FY24, even 1% fall is huge for companies.

Foreign Debt interest rate increases Companies with ECBs or FCCBs pay more rupees to service the same dollar debt. **India's external debt stood at \$747.2 billion in mid 2025**, with corporates holding the largest short term share. Companies like Adani Ports and Tata Steel with large dollar debt book large current capital losses.

Domestically Earning Companies Lose on Both Sides Companies earning entirely in rupees like retail, FMCG, domestic auto etc Get zero export benefit while facing **rising imported input costs**. Maruti sources components internationally, so depreciation raises its bill of materials with

no revenue increase. Simultaneously, **inflation downs consumer purchasing power**, hurting domestic demand.

FPIs pulling out money A 10% rupee depreciation turns a 15% rupee return into roughly 5% in dollar that becomes unattractive against US treasuries. Between November 2024 and January 2025, **FPIs pulled Rs. 38,000 crore from Indian markets during rupee weakness**, dragging down stock prices of fundamentally sound companies thus hurting them.

Rupee Weakness Forces RBI to Tighten policies thus Hurting Every Company

Depreciation triggers high inflation, which forces RBI rate hikes, which raises borrowing costs country wide. This second order effect hits **every capital intensive Indian company through higher working capital costs, tightened margins, and lower valuations**. India went through this exact cycle in 2022.

"Falling interest rates are always good for equities"

When this statement is true:-

Cheaper Cost of Capital Expands Corporate Profitability When rates fall, companies borrow at lower costs, directly expanding margins. Capital intensive sectors like infrastructure, real estate, and manufacturing benefit immediately as their interest burden drops, **improving future earnings expectations and pushing stock prices higher**.

Growth Stocks Get Disproportionately Re-rated Growth stocks derive most of their value from future cash flows discounted(DCF method) to present value. When the discount rate falls, the present value of those future earnings rises mechanically. This is why the 2020 Fed rate cut to near zero triggered one of the sharpest growth stock rallies in history the **Nasdaq gained over 40% between March and December 2020** purely on the back of rate driven multiple expansion.

Dividend Paying Sectors Become Relatively Attractive When bond yields fall, fixed income(coupons by Bonds) becomes less attractive compared to dividend paying equities. Investors rotate from bonds into utilities, REITs, and consumer staples to chase yield. Indian REIT stocks and utility companies like **NTPC and Power Grid historically see strong inflows during rate cuts** as their stable dividend yields look attractive relative to falling fixed deposit rates.

Consumer Spending and Credit Growth Accelerate Lower EMIs make home loans, auto loans, and personal credit accessible to a wider population. This directly benefits banks through higher loan disbursements, real estate developers through improved affordability, and consumer centric companies through higher spending. **India's 2019 rate cut cycle saw home loan rates drop to multi year lows**, briefly reviving residential real estate volumes across major cities.

Sentiment and Liquidity Drive Broad Market Rate cuts signal that the central bank is supportive of growth, improving investor confidence broadly. Cheaper borrowing also pushes institutional money out of low yielding instruments like-bond into equities, lowering risk

premiums and lifting valuations across the board even for companies not directly benefiting from lower rates operationally.

When this statement is not true:-

Banks Get Structurally Hurt Falling rates compress net interest margins **HDFC Bank and Axis Bank saw NIM compression during India's 2019-20 rate cuts(5.15%→4%) even as the broader market rallied.** Lower rates directly damage the sector with the largest index weight.

2nd Order Market Reaction:-Rate Cuts Signal weak and Aggressive rate cuts confirm economic weakness. The 2008 Fed cuts and India's 2020 pandemic cuts that were high cuts were followed by sharp equity selloffs as it **confirms something wrong fundamentals among the economy itself.**

Liquidity Trap happens When rates approach zero, rate cuts stop working. **When rate is highly cut , equity market stops reacting to the cuts.**

Low rates push companies to borrow aggressively. US corporate debt hit record levels during 2020-21. **When the Fed hiked in 2022(4.25%→0.25%), over borrowed companies saw earnings collapse,** reversing years of rate cut driven equity gains. Thus it is a after effect how returning to the normal is worse for companies.

When interest rates fall, the current calculated cost of future pension payouts automatically goes up. **This increase pension liability of large, older companies and leaves less free cash leftover for the shareholders.**

Keeping interest rates too low for too long **pumps up stock prices way past what the companies are actually worth. When the market inevitably corrects itself, the crash wipes out those artificial gains thus facing a collapse** that was pumped artificially.

Overall Moneycontrol, Business standard , Investopedia , Economic times , NSE india and announcements is used for every question.
